This makes it easy to visualize urban sprawl as an isolated physical phenomenon. However, the "edge" that is being expanded into is actually an area of roadways, freeways, subdivisions, and commercial centers. This is where the environmental impacts of urban sprawl become much more difficult to comprehend and control. If a densely populated area becomes separated from the surrounding areas by a built environment, it is difficult to comprehend why development should not also take place in the areas surrounding the city. The environmental effects of urban sprawl become even more difficult to deal with when combined with other effects, such as the creation of vast areas of paved surfaces, as well as the destruction and contamination of natural habitats, such as lakes, rivers, and wetlands. If the focus is on a particular section of land, it can be easier to visualize the effects of urban sprawl and to influence the results. But if you begin to consider the area between the edge and the edge, then the situation becomes even more complicated. The difficulty lies in the vast area of land that is added to the urban core by roadways, freeways, and other sources of development. Two examples illustrate the problem. In the first, traffic is managed on a narrow beltway that serves a residential area, a municipal airport, and an industrial park. The airport is currently connected to the residential and industrial areas through a series of arterial streets. However, the airport and the residential areas are being linked by a new four lane highway. The second example involves a large, heavily used bay. It is surrounded by a series of islands and peninsulas. In
